1. As you discovered the many uses of numbers, did any of the uses surprise you?

Why? Why not?

Yes, because I have never used graphing calculator or partial sums. Partial sums the best. Also graphing calculators are cool too.

2. When you are filling in a name collection box, do you find that you tend to use one operation more than any other? How could you break this habit? If you don't have this habit, what advice would you give a classmate to help him or her think creatively about different names for numbers?

Not really, because I use all of the operations a few times but sometimes I use addition a lot. I use addition a lot because it is a lot easier for me to use it. Well I can break this habit by liking a new operation.

3. What is the hardest part of adding or subtracting multidigit numbers? What did you do to overcome these difficulty?
