1. As you discovered the many uses of numbers, did any of the uses surprise you?

Why? Why not?

No, because it is just math. And math is not surprising, it is cool, but not surprising

2. When you are filling in a name-collection box, do you find that you tend to use one operation more than any other? How could you break this habit? If you do not have this habit, what advice would you give a classmate to help him or her think creatively about different names for numbers?

No, because it is pretty easy to use different operations. Maybe ask a parent for help.

3. What is the hardest part of adding or subtracting multidigit numbers? What did you do to overcome these difficulties?

The hardest part is the that there is so much carrying. I overcomed them.
